

Yontrack V6 — Evidence & audit trail: client call checklist

Client: _____ Date: _____ Attendees: Delivery engineer, Product lead

1. Audit driver	Which audits/regulations (ISO 27001, SOC 2, 21 CFR Part 11, internal only)? Who consumes the trail: internal auditor, external auditor, legal?
2. Evidence sources	Which tools produce the evidence (SonarQube, DAST, SBOM, pen-test PDFs...)? Formats (PDF/HTML/JSON)? Typical size and count per build?
3. Scope of the trail	Whole build story (dependencies, promotions, deployments, workflows) or just validation attachments? Which part matters most?
4. Legal weight	Is "tamper-evident + instance signature" enough, or do they need third-party notarization (RFC 3161 TSA, eIDAS-qualified timestamp)?
5. Existing TSA / PKI	Do they already run a corporate timestamping authority or PKI they'd want Yontrack to use? Who owns it?
6. Signer identity	Should entries carry the CI identity (Jenkins/GitHub OIDC) as well as the instance seal? Which CI do they use?
7. Storage	Can they provide an S3-compatible bucket? Would they enable Object Lock / WORM? Data-residency or encryption-at-rest constraints?
8. Retention	How long must audit packages be kept (years)? Must they survive build purge? Is "seal on demand" enough, or automatic sealing on promotion/deployment?
9. Export format	What does the auditor accept: ZIP + manifest + hashes, PDF summary, in-toto/DSSE bundle, ASiC-E? Offline verification without Yontrack needed?

10. Access control	Who may upload evidence, seal, export, delete? Need a read-only "auditor" role?
11. Instance-level audit	Need a log of audit-config changes, key rollovers and deletions ("who changed the audit settings")?
12. Integration path	Push evidence via API/KDSL from pipelines, or expect Yontrack to pull from the tools?
13. Volume & cost	Builds per day, share that would be sealed; acceptable storage cost.
14. Licensing	Feature would be licensed: acceptable, and at what scope (instance, project)?
15. Timeline & partnership	When do they need it (next audit date)? Willing to be a design partner / early tester (MinIO in staging)?
